

Transition Metal Coordination Chemistry

Asst. Prof. Dr. Abbas A. S. Al- Hamdani

Lecture 1:

What's interesting about Transition Metal Coordination Chemistry?

Who's idea was it anyway?

Recommended books

Transition Elements Properties

Properties:

- There are several common characteristic properties of transition elements:
 - · They often form colored compounds.
 - · They can have a variety of different oxidation states.
 - · They are often good catalysts.
 - · They are silvery-blue at room temperature (except copper and gold).
 - · They are solids at room temperature (except mercury).
 - · They form complexes.
 - · Transition metals exhibit interesting magnetic (Bara magnetic properties)

Horizontal Trends in Period 4 Elements

Ch. 24

11

loss of ns e⁻s

loss of ns and (n-1)d e⁻s

Working out numbers of d-electrons from oxidation states:

1st: how many electrons are there in the shell?

- count along the periodic table

e.g. Mn = 7 electrons

Cu = 11 electrons

Ce	Pr	Nd	Pm	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb	Lu				
Th	Pa	U	Np	Pu	Am	Cm	Bk	Cf	Es	Fm	Md	No	Lr				

2nd: how many electrons are lost?

- oxidation state

e.g. Mn(VII) = 7 electrons lost Cu(II) = 2 electrons lost

3rd: how many electrons left over?

- subtract

e.g. Mn(VII) = 7 - 7 = no d-electrons, d^0 Cu(II) = 11 - 2 = 9 d-electrons = d^9

Rule: The electrons in the s-orbital are the first to be lost

Hence the only valance electrons available in a transition metal ion are d-electrons

Oxidation States of Manganese

Table 23.5 Some Oxidation States of Manganese

Oxidation state*	Mn(II)	Mn(III)	Mn(IV)	Mn(VI)	Mn(VII)
Example	Mn²⁺	Mn ₂ O ₃	MnO ₂	MnO ₄ ²⁻	MnO ₄ ⁻
Ion configuration	<i>d</i> ⁵	<i>d</i> ⁴	<i>d</i> ³	<i>d</i> ¹	<i>d</i> ⁰
Oxide acidity

cis-isomer

the first of a series of platinum coordination complex-based anti-cancer drugs

(Platinol-AQ)

Chain Theories (Blomstrand – Jorgensen)

Blomstrand then Jorgensen proposed chain structures

Only three atoms directly bonded to Co, directly bonded Cl atoms have stronger bonds than those bonded to N. Nitrogen atoms form

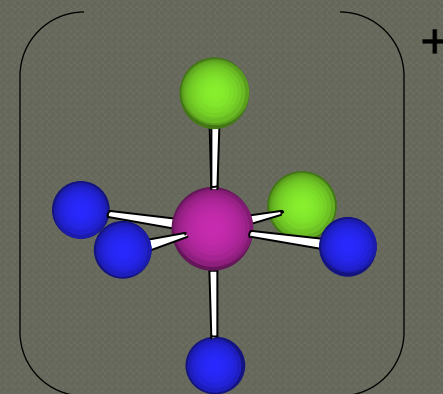

chains like C and have valence of five e.g. $\text{CoCl}_3 \cdot 6\text{NH}_3$ with three available chlorides

Alfred Werner – Nobel Prizewinner 1913

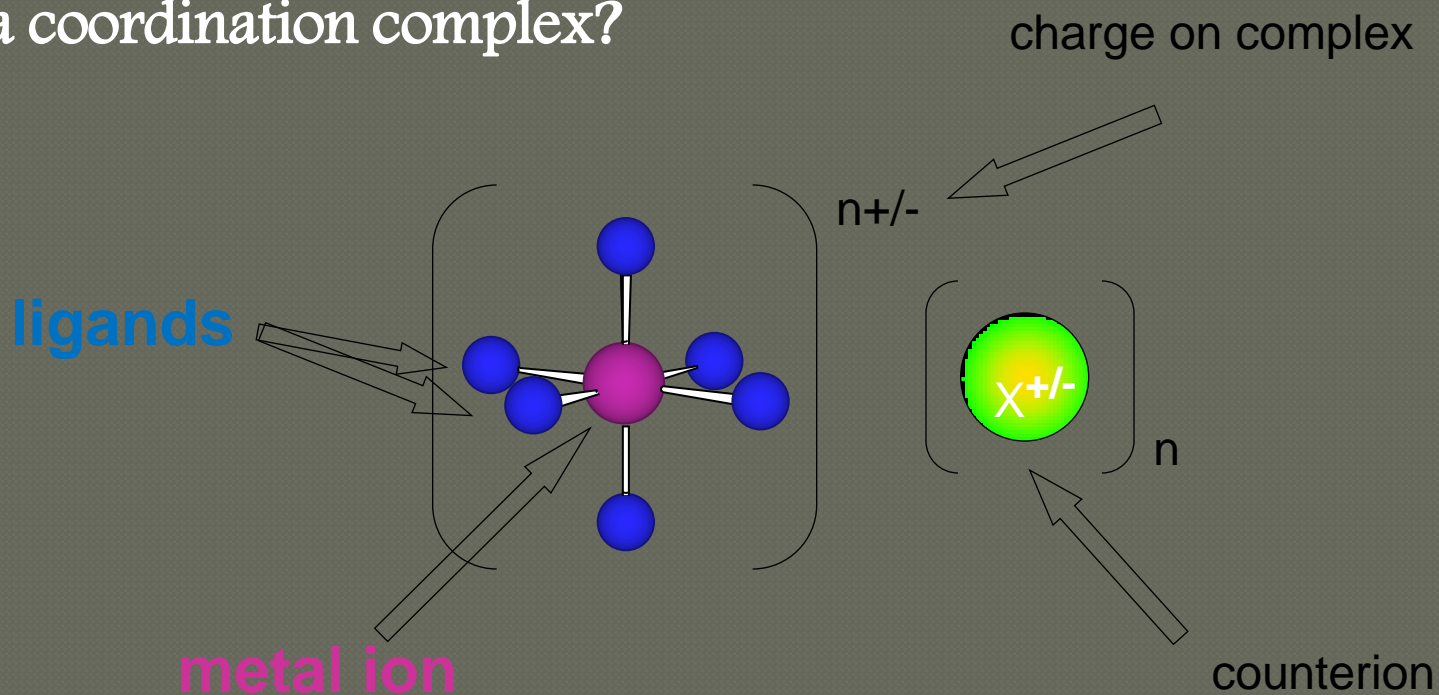

$\text{CoCl}_3 \cdot 6\text{NH}_3$	yellow	xs Ag^+	3 moles AgCl
$\text{CoCl}_3 \cdot 5\text{NH}_3$	purple	xs Ag^+	2 moles AgCl
$\text{CoCl}_3 \cdot 4\text{NH}_3$	green	xs Ag^+	1 mole AgCl
$\text{CoCl}_3 \cdot 3\text{NH}_3$		xs Ag^+	0 moles AgCl

Werner's conclusions

1. The metal is in a particular **oxidation state** (primary valency)
2. The complex has a fixed **coordination number** (secondary valency)
3. The ligands are bound to the metal *via* a bond which resembles a covalent bond

What is a coordination complex?

Central metal ion or atom surrounded by a set of ligands

The ligand donates two electrons to the d-orbitals around the metal forming a **dative or coordinate bond**

Alfred Werner and Coordination Compounds

Table 23.10 Some Coordination Compounds of Cobalt Studied by Werner

Werner's Data*

Traditional Formula	Total Ions	Free Cl^-	Modern Formula	Charge of Complex Ion
$\text{CoCl}_3 \cdot 6\text{NH}_3$	4	3	$[\text{Co}(\text{NH}_3)_6]\text{Cl}_3$	3+
$\text{CoCl}_3 \cdot 5\text{NH}_3$	3	2	$[\text{Co}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$	2+
$\text{CoCl}_3 \cdot 4\text{NH}_3$	2	1	$[\text{Co}(\text{NH}_3)_4\text{Cl}_2]\text{Cl}$	1+
$\text{CoCl}_3 \cdot 3\text{NH}_3$	0	0	$[\text{Co}(\text{NH}_3)_3\text{Cl}_3]$	—
